

Image Curation Document: Nikhil Mahindrakar

This document outlines the strategic selection, justification, and evaluative criteria for visual assets. It serves as a blueprint to ensure visual cohesion across all professional platforms and project documentation.

1. Image Inventory & Source Selection

The following assets have been curated to balance authenticity with modern design aesthetics. The selection focuses on technical credibility and visual consistency.

Slot / Purpose	Asset Type	Chosen Source	Justification
Profile / Headshot	Personal Photo		Authentic representation builds trust; AI stand-ins feel uncanny and disingenuous for personal branding.
Project 1: Multi Agent Software Developer	Workflow / Architecture Diagram		Authentic technical proof. Real code/pipeline visual demonstrates actual execution over hypothetical concepts.

Slot / Purpose	Asset Type	Chosen Source	Justification
Hero Background Asset	Texture / Visual Pattern		Subtle abstract geometric pattern set in #0F172A / #2563EB to provide visual cohesion without clutter.

2. Discernment & Rejection Log (Graded Evaluation)

This section details the iterative process of visual selection, highlighting why certain assets were discarded in favor of more effective solutions.

Rejected Image 1: Hero Visual (AI Generated)

- **Prompt Used:** "Futuristic AI neural network glowing nodes in dark blue background"
- **Why it was rejected:** The generated image was overly complex, cliché, and contained excessive glowing artifacts that distracted from the main heading text. It violated the clean, precise, minimal mood established in the identity kit.
- **Final Choice:** Replaced with a flat, geometric, low-contrast structural mesh in #0F172A.

Rejected Image 2: Project Visual (AI Generated)

- **Prompt Used:** "3D isometric render of a brain scan computer screen on a tech desk"
 - **Why it was rejected:** It looked like a generic stock image and did not show any actual code, evaluation metrics, or model architecture. A real screenshot of the actual pipeline outputs provided far stronger proof of skill.
 - **Final Choice:** Real capture of the technical workflow and architecture diagram.
